

The Air Pad feeder by Dynamic Air is an all air operated feeder which is adaptable to feed and/or convey most dry bulk solids where the particle size is smaller than 30 mesh. It is ideal for feeding weigh scales and for short conveying distances. The feed rate is infinitely adjustable to meet even the most

stringent of applications. Many different nozzle sizes are available for a wide variety of applications to meet almost every customer requirement. The Air Pad feeder has few moving parts and it uses high pressure compressed air to fluidize the material to move it in a horizontal direction.
