

The Series 422 BulkBuster<sup>™</sup> Traveling Scissors Lift was designed for bulk bag unloading operations where headroom is limited or must be kept to a minimum. The bulk bags can be skid mounted and put into position with a simple pallet jack or fork lift. The scissors lift then lifts the bulk bag and moves it into position over the unloading spot, where the

contents can be discharged into a process mixer or hopper. A set of two or four optional jostlers help discharge granular materials with a positive but controlled flow. The BulkBuster Scissors Lift is completely air operated and requires no electrical hookup.
