The Accu-Flo™ double screw feeders with hoppers include level controls and twin screw feeders for slow and fast feed of two different granular materials. In addition, double built-in cartridge filters filter the air when conveying into the hoppers from a pneumatic conveying system. This is a low profile approach when there are headroom constraints. These hoppers also include necessary Vibra-Jet® bin aerators for more effective bin discharging of materials which need flow aids. Also, each hopper includes a manhole for quick and easy maintenance inspection.
